AFP: Mood drug inhibits breast cancer medication: study

One of the biggest dangers of prescription drugs, no matter what the reason you are taking them for, is the side effects. In a lot of cases, the side effects can be as bad or even worse than the condition they are trying to treat. The side effects can be even worse when you start combining drugs.

A new study shows that mood drugs may interfere with the effectiveness of breast cancer medication and can even result in death. I am not saying you should avoid prescription drugs in all cases (I do not know if there is a natural alternative in this case, but in many cases there are), but natural remedies rarely have the same severe side effects that prescription drugs do so you should check out natural remedies before you start taking a bunch of dangerous drugs.

Check out the excerpt from article below then click on the link at the bottom to check out the original story.

Women who take the mood drug paroxetine -- better known by its brand names Paxil and Seroxat -- at the same time as the breast cancer medication tamoxifen face an increased risk of death, researchers reported.
