How do Optical Illusions Work?

After you have check out the blog post below on optical illusions find out how optical illusions work. Find out what makes things look bigger or smaller or even a different color than how it is supposed to look. Click here to find out how optical illusions work.

Illusions often result due to mistaken judgments or erroneous vision. An error in estimating the distance to an object is due to mistaken judgment. A bright object often appears larger than a dark object of same dimensions. When objects of contrasting colors are placed in close vicinity, a certain color may be mistaken to be another. This is an error in sensing the object.
